

WeatherPy

September 23, 2019

0.1 # WeatherPy

Whether financial, political, or social – data’s true power lies in its ability to answer questions definitively. So we will be using Python requests, APIs, and JSON traversals to answer a fundamental question: “What’s the weather like as we approach the equator?”

We will be creating a Python script to visualize the weather of 500+ cities across the world of varying distance from the equator. To accomplish this, you’ll be utilizing a [simple Python library](#), the [OpenWeatherMap API](#), and a little common sense to create a representative model of weather across world cities.

Our Objective is to build a series of scatter plots to showcase the following relationships:

- Temperature (F) vs. Latitude
- Humidity (%) vs. Latitude
- Cloudiness (%) vs. Latitude
- Wind Speed (mph) vs. Latitude

0.2 Analysis

0.2.1 Observed Trend 1

From the Latitude Vs Temperature Plot, we can infer that

- 1) The temperatures are higher when they are close to the equator (Latitude Range : -20 to 25).
- 2) The temperature are lower when they are away from the equator (Latitude Range : 60 to 80).

Lower the Latitude -> Higher the Temperature

Higher the Latitude -> Lower the Temperature

0.2.2 Observed Trend 2

From the Latitude Vs Humidity Plot, we can infer that

- 1) Humidity is reatively consistent across all the latitudes.
- 2) Correlation between Latitude and Humidity is fragile.

0.2.3 Observed Trend 3

From the Latitude Vs Cloudiness Plot, we can infer that

- 1) Cloudiness is reatively consistent across all the latitudes.

- 2) There is no Correlation between Latitude and Cloudiness but the Cloudiness at 0% , 78%, 100% is strong.

0.2.4 Observed Trend 4

From the Latitude Vs Wind Speed Plot, we can infer that

- 1) The highest wind speed outliers occurs when we move away from the equator.
- 2) Regardless the latitude, Wind Speed tends to be generally between 0 and 15 mph.

0.3 Implementation

```
[31]: # Dependencies and Setup
import matplotlib.pyplot as plt
import pandas as pd
import numpy as np
import requests
import time
import json

# Import API key
from api_keys import api_key

# Incorporated citipy to determine city based on latitude and longitude
from citipy import citipy

# Range of latitudes and longitudes
lat_range = (-90, 90)
lng_range = (-180, 180)
```

0.4 Generate Cities List

```
[41]: # List for holding lat_lngs and cities
lat_lngs = []
cities = []

Analysis_Date = pd.Timestamp('today').strftime('%m/%d/%Y')

# Create a set of random lat and lng combinations
lats = np.random.uniform(low=-90.000, high=90.000, size=1500)
lngs = np.random.uniform(low=-180.000, high=180.000, size=1500)
lat_lngs = zip(lats, lngs)

# Identify nearest city for each lat, lng combination
for lat_lng in lat_lngs:
    city = citipy.nearest_city(lat_lng[0], lat_lng[1]).city_name
    city = city.replace(" ", "%20")

# If the city is unique, then add it to a our cities list
```

```

        if city not in cities:
            cities.append(city)

# Print the city count to confirm sufficient count
len(cities)

```

[41]: 625

0.4.1 Perform API Calls

- Perform a weather check on each city using a series of successive API calls.
- Include a print log of each city as it's being processed (with the city number and city name).

```

[42]: #Base URL
base_url = "http://api.openweathermap.org/data/2.5/weather?
↳units=Imperial&APPID=" + api_key

#Creating an empty list to store the API Data

City = []
Cloudiness = []
Country = []
Date = []
Humidity = []
Lat = []
Lng = []
Max_Temp = []
Wind_Speed = []

Record_Count = 1
Set_Count = 1

print("-----")
print("          Beginning Data Retrieval")
print("-----")

for city in cities:

    try:

        response = requests.get(base_url + "&q=" + city).json()
        City.append(response["name"])

4      80.03     16.42

```

0.4.3 Plotting the Data

- Use proper labeling of the plots using plot titles (including date of analysis) and axes labels.
- Save the plotted figures as .pngs.

Latitude vs. Temperature Plot

```

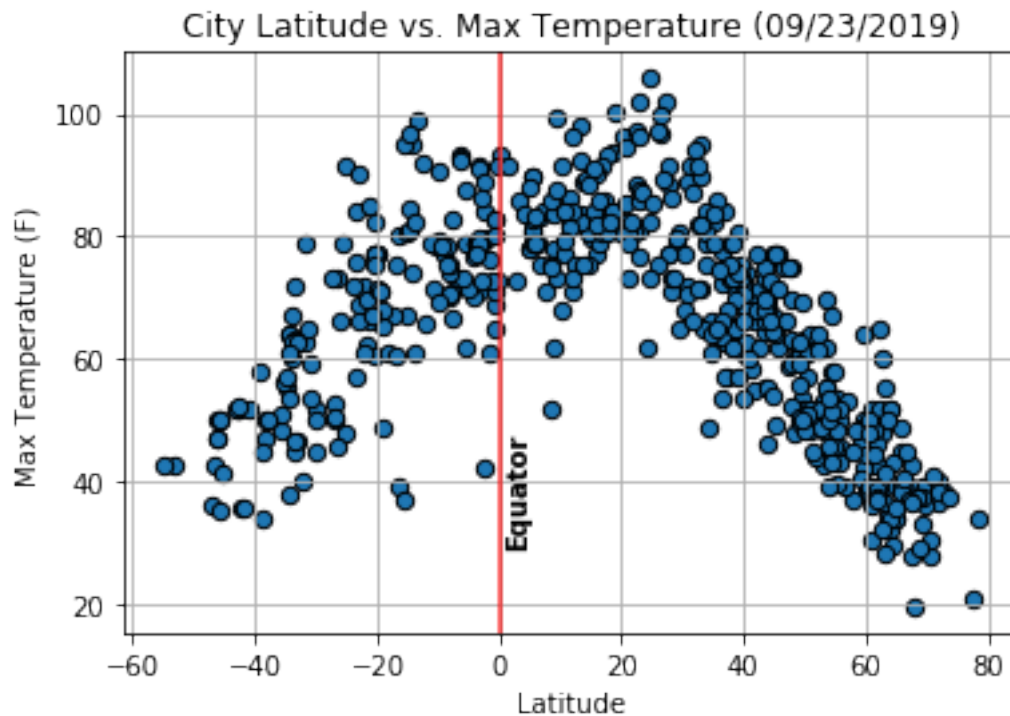

[107]: #Plotting a Scatter Plot
plt.scatter(WeatherPy_df["Lat"], WeatherPy_df["Max Temp"], marker="o",
            edgecolors="black",s=40)

#Proper labeling of the plots using plot titles (including date of analysis)
            and axes labels.
plt.grid()
plt.title(f"City Latitude vs. Max Temperature ({Analysis_Date})")
plt.xlabel("Latitude")
plt.ylabel("Max Temperature (F)")
plt.axvline(0, color = 'red', alpha = .75)
plt.text(1,30,'Equator',rotation=90, fontweight='bold')

#Saving the Plotted figures and displaying the plot.
plt.savefig("Plotted Figures/Latitude_vs_Temperature.png")

```

```
plt.show()
```

0.4.4 Observation

From the Latitude Vs Temperature Plot, we can infer that

- 1) The temperatures are higher when they are close to the equator (Latitude Range : -20 to 25).
- 2) The temperature are lower when they are away from the equator (Latitude Range : 60 to 80).

Lower the Latitude → Higher the Temperature

Higher the Latitude → Lower the Temperature

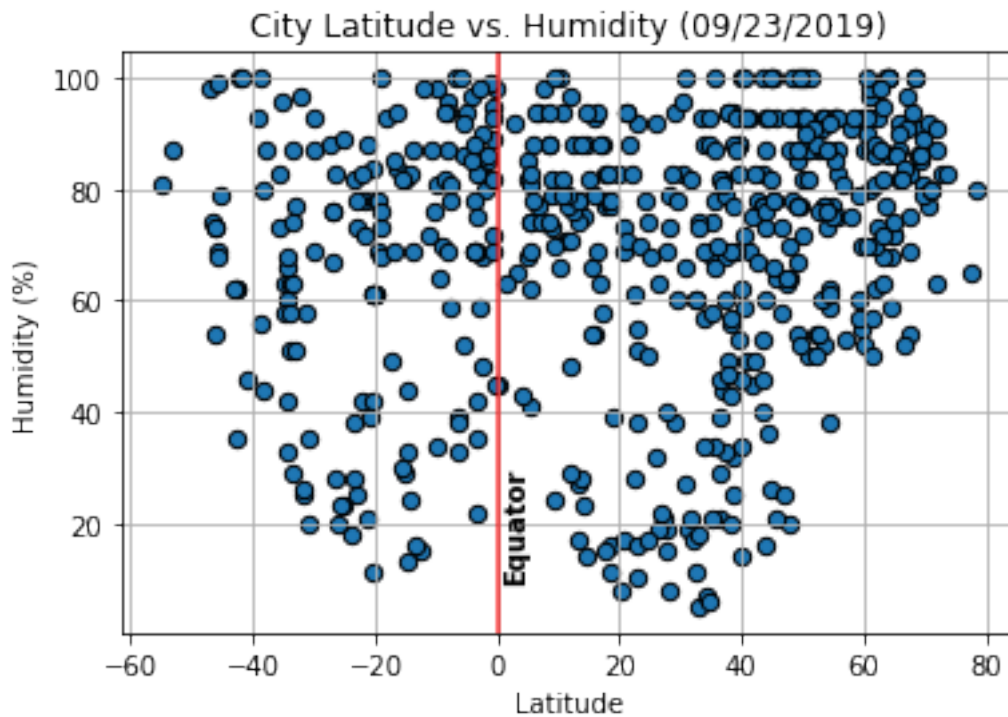

Latitude vs. Humidity Plot

```
[108]: #Plotting a Scatter Plot
plt.scatter(WeatherPy_df["Lat"], WeatherPy_df["Humidity"], marker="o",
            ↪edgecolors="black",s=40)

#Proper labeling of the plots using plot titles (including date of analysis)
↪and axes labels.
plt.grid()
plt.title(f"City Latitude vs. Humidity ({Analysis_Date})")
plt.xlabel("Latitude")
```

```
plt.ylabel("Humidity (%)")
plt.axvline(0, color = 'red', alpha = .75)
plt.text(1,10,'Equator',rotation=90,fontweight='bold')

#Saving the Plotted figures and displaying the plot.
plt.savefig("Plotted Figures/Latitude_vs_Humidity.png")
plt.show()
```

0.4.5 Observation

From the Latitude Vs Humidity Plot, we can infer that

- 1) Humidity is relatively consistent across all the latitudes.
- 2) Correlation between Latitude and Humidity is fragile.

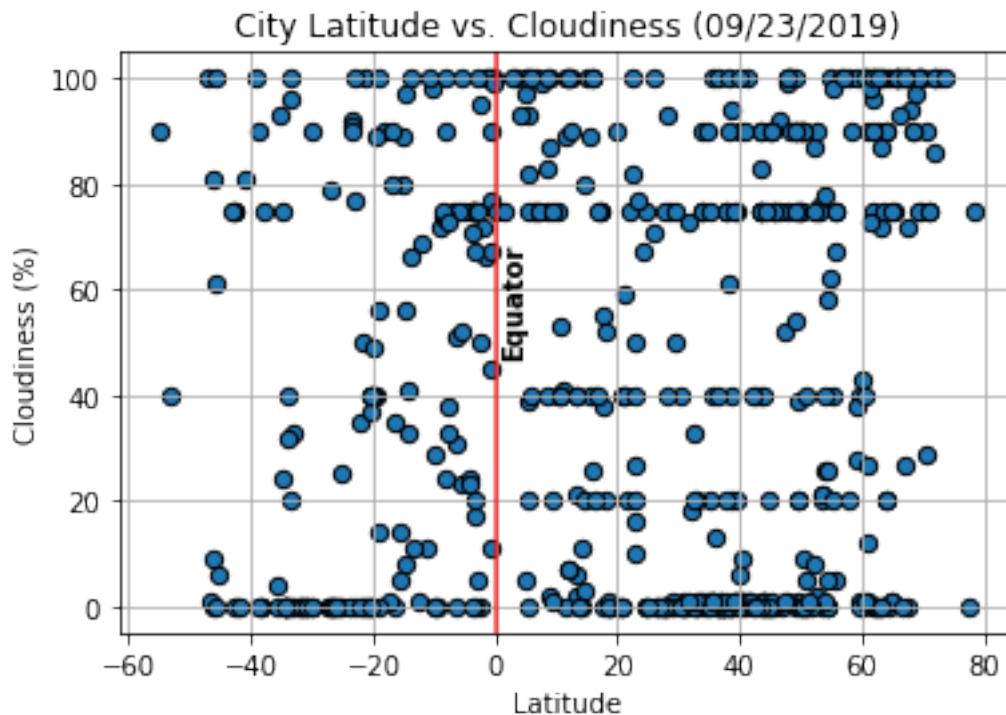

Latitude vs. Cloudiness Plot

```
[109]: #Plotting a Scatter Plot
plt.scatter(WeatherPy_df["Lat"], WeatherPy_df["Cloudiness"], marker="o",
            ↪edgecolors="black",s=40)

#Proper labeling of the plots using plot titles (including date of analysis)
            ↪and axes labels.
plt.grid()
```

```
plt.title(f"City Latitude vs. Cloudiness ({Analysis_Date})")
plt.xlabel("Latitude")
plt.ylabel("Cloudiness (%)")
plt.axvline(0, color = 'red', alpha = .75)
plt.text(1,48,'Equator',rotation=90, fontweight='bold')

#Saving the Plotted figures and displaying the plot.
plt.savefig("Plotted Figures/Latitude_vs_Cloudiness.png")
plt.show()
```

0.4.6 Observation

From the Latitude Vs Cloudiness Plot, we can infer that

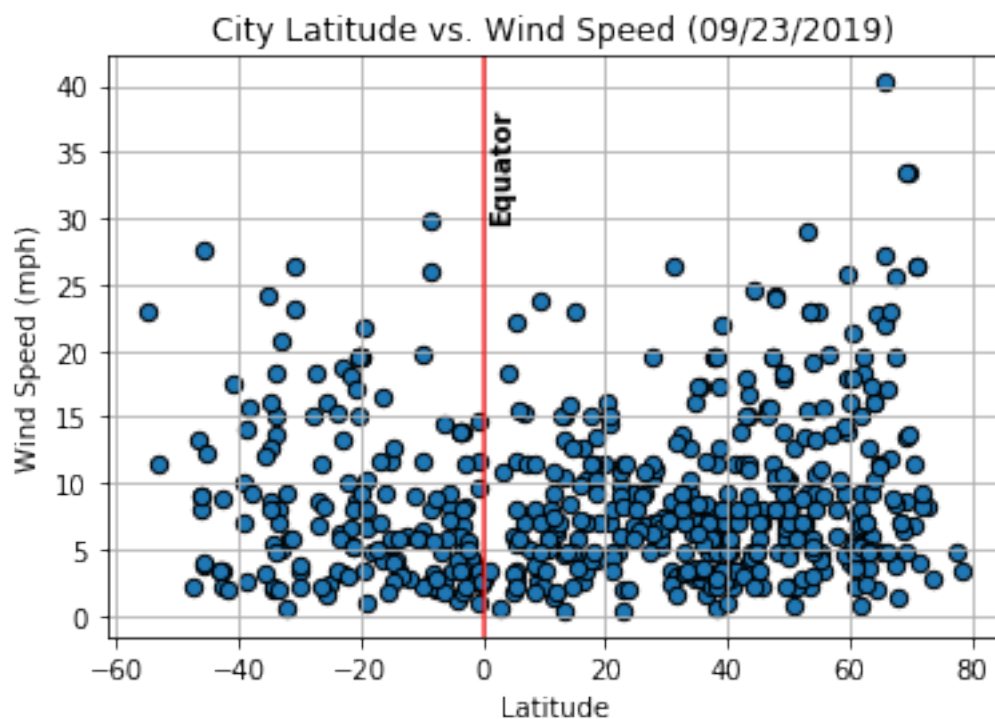

- 1) Cloudiness is relatively consistent across all the latitudes
- 2) There is no Correlation between Latitude and Cloudiness but the Cloudiness at 0% , 78%, 100% is strong.

Latitude vs. Wind Speed Plot

```
[111]: #Plotting a Scatter Plot
plt.scatter(WeatherPy_df["Lat"], WeatherPy_df["Wind Speed"], marker="o",
           edgecolors="black",s=40)
```

```
#Proper labeling of the plots using plot titles (including date of analysis) and axes labels.
plt.grid()
plt.title(f"City Latitude vs. Wind Speed ({Analysis_Date})")
plt.xlabel("Latitude")
plt.ylabel("Wind Speed (mph)")
plt.axvline(0, color = 'red', alpha = .75)
plt.text(1,30,'Equator',rotation=90, fontweight='bold')

#Saving the Plotted figures and displaying the plot.
plt.savefig("Plotted Figures/Latitude_vs_WindSpeed.png")
plt.show()
```

0.4.7 Observation

From the Latitude Vs Wind Speed Plot, we can infer that

- 1) The highest wind speed outliers occurs when we move away from the equator.
- 2) Regardless the latitude, Wind Speed tends to be generally between 0 and 15 mph.

[]:
